Example of cross-laminated deck plate

Ruderting

Section 2 Basis of design

$$R_d \leq \frac{k_{mod} \cdot R_k}{\gamma_M}$$

10

Section 2 Basis of design

1. Timber and wood-based materials	
-normal verification -solid timber -glued laminated timber -LVL, plywood, OSB	$\gamma_{M} = 1,3$ $\gamma_{M} = 1,25$ $\gamma_{M} = 1,2$
 -fatigue verification 2. Connections - normal verification - fatigue verification 	$\gamma_{\mathrm{M}} = 1.0$ $\gamma_{\mathrm{M}} = 1.3$ $\gamma_{\mathrm{M}} = 1.0$
3. Steel used in composite members	
4. Concrete used in composite members	$\gamma_{\mathbf{M}} = 1.15$ $\gamma_{\mathbf{M}} = 1.5$
 5. Shear connectors between composite members normal verification fatigue verification 	$\gamma_{\mathrm{M}} = 1.25$ $\gamma_{\mathrm{M}} = 1.0$
6.Pre-stressing steel elements	$\gamma_{\rm M} = 1.15$

Section 3 Material properties

Section 3 Material properties

(1)P Pre-stressing steels shall comply with EN 10138-1 and EN 10138-4.

Section 4 Durability

- 4.1 Timber
- (1)The effect of precipitation, wind and solar should be taken into account
- 4.2 Resistance to corrosion
- 4.3 Protection of timber decks from water by sealing

S E E C E E E E

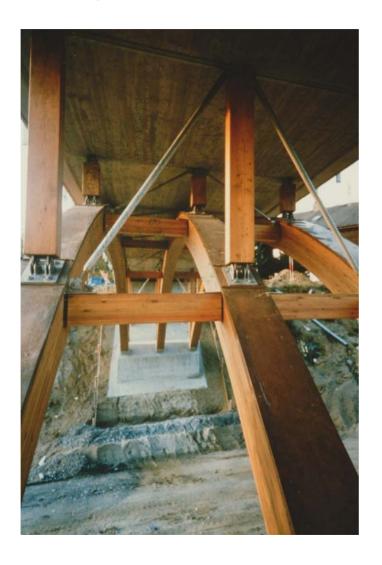

Constructive protection

Bridge in Eching

Constructive protection

South-west-side, roof to small?

Theoretical costs for bridges (Ablöserichtlinien):

Timber bridges: theoretical time of duration 50 years

cost per year

actual: 2%

New proposal:

protected bridges 1,0 %

unprotected bridges 1,8 %

To compare:

Steel bridges: Theoretical time of duration 100 years

costs per year 0,8 %

Timber protection:

Essential task

Documentation in drawings and documents

Part of structural calculation!!

NOTE 2: Where a partial or complete covering of the main structural elements is not practical, durability can be improved by one or more of the following measures:

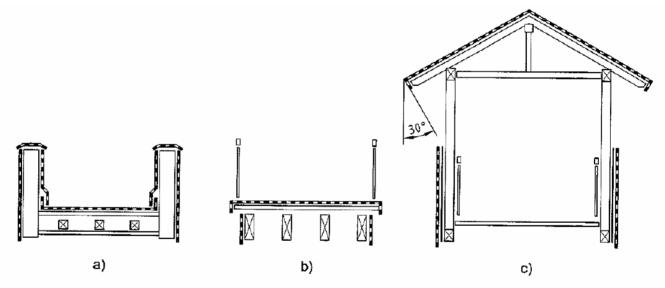

- limiting standing water on timber surfaces through appropriate inclination of surfaces;
- limiting openings, slots, etc., where water may accumulate or infiltrate;
- limiting direct absorption of water (e.g. capillary absorption from concrete foundation) through use of appropriate barriers;
- limiting fissures and delaminations, especially at locations where the end grain would be exposed, by appropriate sealing and/or cover plates;
- limiting swelling and shrinking movements by ensuring an appropriate initial moisture content and by reducing in-service moisture changes through adequate surface protection
- choosing a geometry for the structure that ensures natural ventilation of all timber parts.

Section 5 Basis of structural analysis

- 5.1 Laminated deck plates
- 5.1.1 General
- (1) The analysis of timber deck plates should be based upon:
 - the orthotropic plate theory;
 - modelling the deck plate by a grid
 - a simplified method according to 5.1.3

 \mathbb{C}

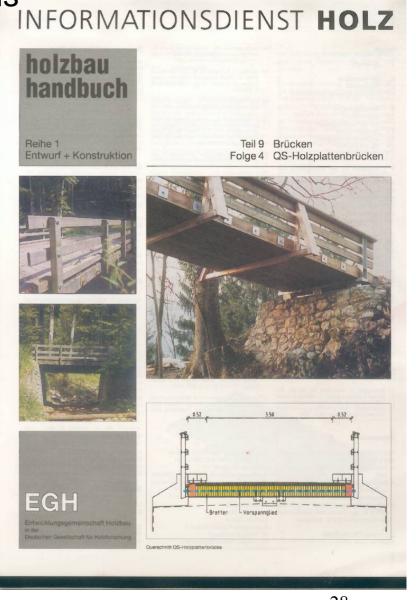

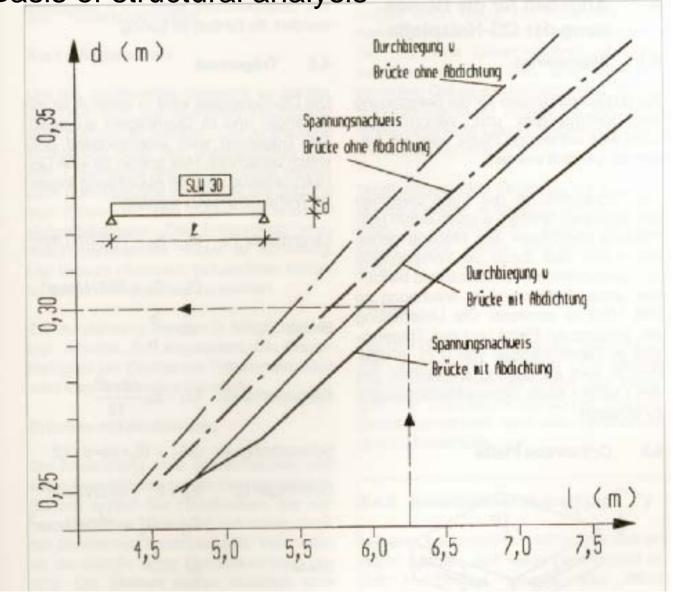

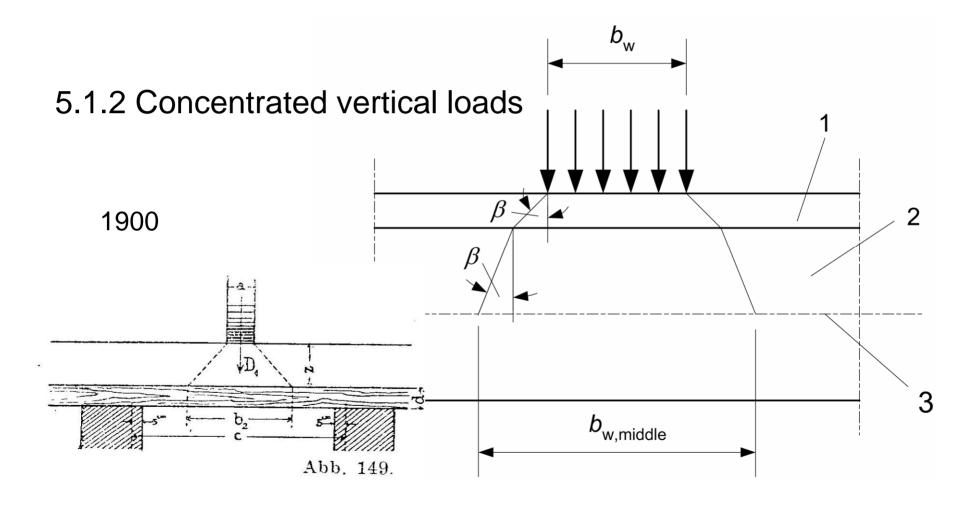

Table 5.1 – System properties of laminated deck plates

Type of deck plate	$E_{ m 90,mean}/E_{ m 0,mean}$	$G_{0, m mean}/E_{0, m mean}$	$G_{90, m mean}/G_{0, m mean}$
Nail-laminated Stress-laminated -sawn sawn	0	0,06	0,05
–planed planed Glued-laminated	0,015 0,020 0,030	0,06 0,06 0,06	0,08 0,10 0,15

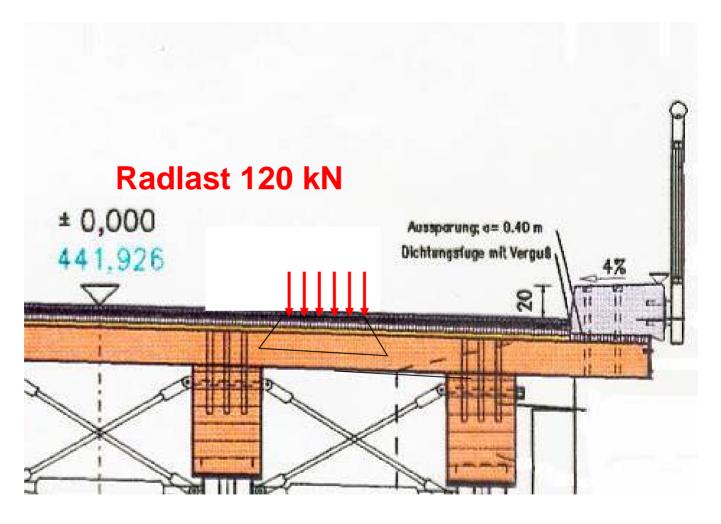

5.1.3 Simplified analysis

$$b_{ef} = b_{w,middle} + a$$

Deck plate system	a m
Nail-laminated deck plate	0,1
Stress-laminated or glued laminated	0,3
Cross-laminated timber	0,5
Composite concrete/timber deck structure	0,6

Pavement (in accordance with EN 1991-2 clause 4.3.6)	45°
Boards and planks	45°
Laminated timber deck plates:	
- in the direction of the grain	45°
- perpendicular to the grain	15°
Plywood and cross-laminated deck plates	45°

Brücke Ruderting, Grossmann

Section 6 Ultimate limit states

Section 6 Ultimate limit states

Eurocode 5.1, EN 1995-1-1!

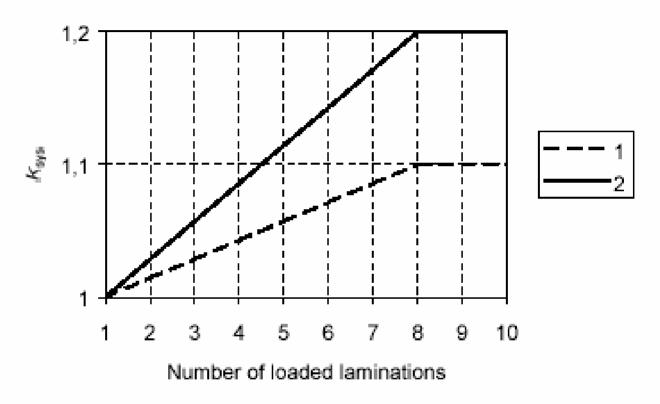

- 6.1 Deck plates
- 6.1.1 System strength

$$f_{\text{m,d,deck}} = k_{\text{sys}} f_{\text{m,d,lam}}$$

$$f_{\text{v,d,deck}} = k_{\text{sys}} f_{\text{v,d,lam}}$$

Section 6 Ultimate limit states

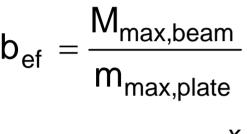

Eurocode 5-1-1, System factor

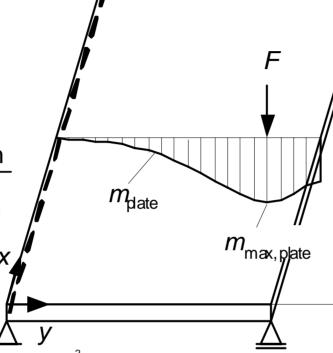

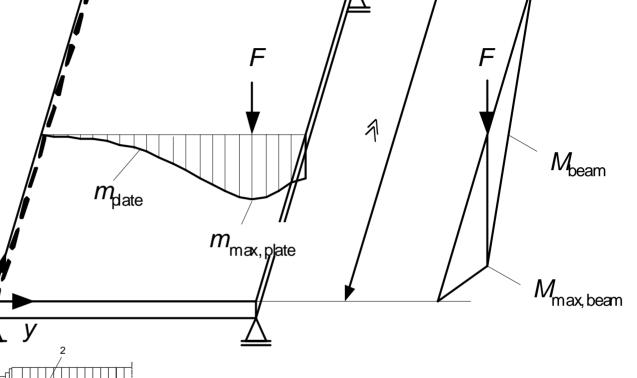

Key:

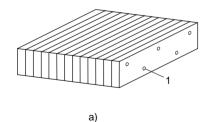

- 1 Nailed or screwed laminations
- 2 Laminations pre-stressed or glued together

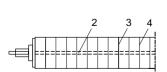

Section 6 Ultimate limit states

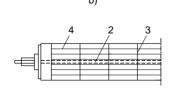

$$n = \frac{b_{ef}}{b_{lam}}$$

Section 6 Ultimate limit states

6.1.2 Stress-laminated deck plates

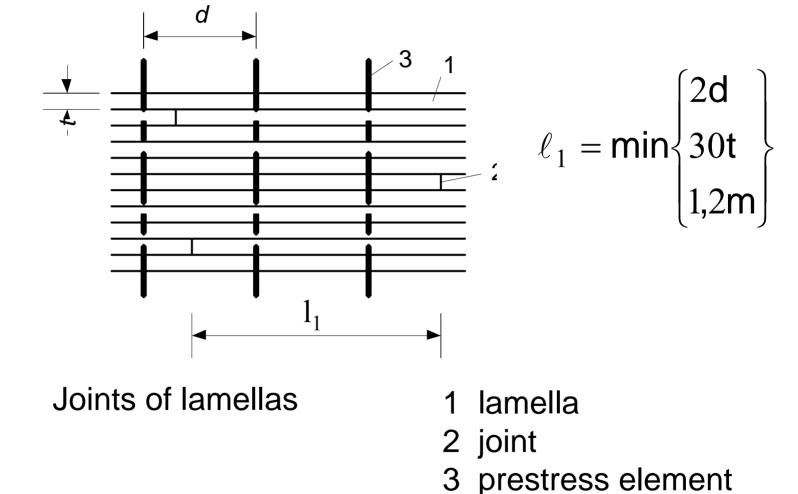

$$F_{v,Ed} \leq \mu_d \cdot \sigma_{p,min} \cdot h$$

$$\sigma_{p,min} = 0.35 \frac{N}{mm^2}$$

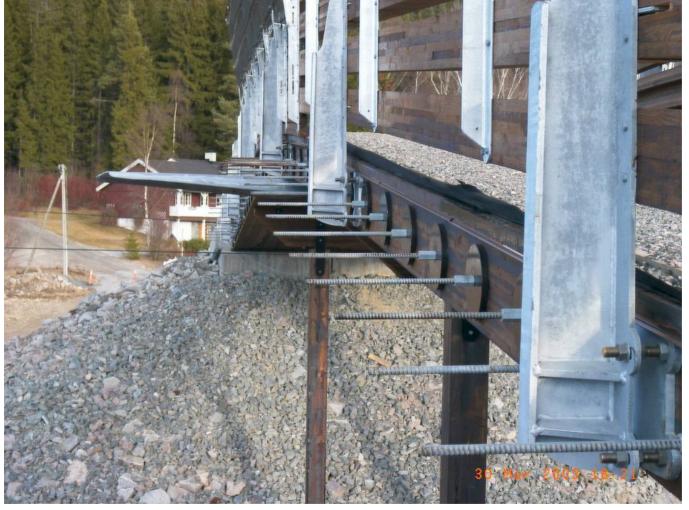

Table 6.1 – Design values of coefficient of friction μ_d

	Perpendicular to grain		Parallel to grain	
Lamination surface roughness	Moisture content ≤ 12 %	Moisture content ≥ 16 %	Moisture content ≤ 12 %	Moisture content ≥ 16 %
Sawn timber to sawn timber	0,30	0,45	0,23	0,35
Planed timber to planed timber	0,20	0,40	0,17	0,30
Sawn timber to planed timber	0,30	0,45	0,23	0,35
Timber to concrete	0,40	0,40	0,40	0,40

Section 6 Ultimate limit states

Bridge across railway, Oslo

Section 8 Connections

Not for bridges:

Nails (withdrawal) staples
Nail plates

Timber-concrete composites

- 1 concrete
- 2 Additional layer
- 3 timber

 $F_{\text{Ed}} = 0.1 \cdot F_{\text{v,ED}}$

Section 8 Connections

Timber – concrete - composite

$$F_{\text{Ed}} = 0.1 \cdot F_{\text{v,ED}}$$

- (3) A fatigue verification is required if the ratio κ given by expression (A.1) is greater than:
- For members in compression perpendicular or parallel to grain: 0,6
- For members in bending or tension: 0,2
- For members in shear: 0,15
- For joints with dowels: 0,4
- For joints with nails: 0,1
- Other joints: 0,15

where:

$$\kappa = \frac{\left|\sigma_{d,\text{max}} - \sigma_{d,\text{min}}\right|}{\frac{f_{k}}{\gamma_{M,\text{fat}}}}$$

$$\kappa = \frac{\left|\sigma_{\text{d,max}} - \sigma_{\text{d,min}}\right|}{\frac{f_{k}}{\gamma_{\text{M,fat}}}}$$

 $\sigma_{d,max}$ is the numerically largest design stress from the fatigue loading;

 $\sigma_{d,min}$ is the numerically smallest design stress from the fatigue loading;

 f_k is the relevant characteristic strength;

 $\gamma_{M,fat}$ is the material partial factor.

(A.1)

- (1) A simplified fatigue load model is built up of reduced loads (effects of actions) compared to the static loading models. The load model should give the maximum and minimum stresses in the actual structural members.
- (2) The fatigue loading from traffic should be obtained from the project specification in conjunction with EN 1991-2.
- (3) The number of constant amplitude stress cycles per year, $N_{\rm obs}$, should either be taken from table 4.5 of EN 1991-2 or, if more detailed information about the actual traffic is available, be taken as:

$$N_{\text{obs}} = 365 n_{\text{ADT}} \alpha t_{\text{L}}$$
 $N_{\text{obs}} = 365 \cdot n_{\text{ADT}} \cdot \alpha \cdot t_{\text{L}}$ (A.2)

where:

 $N_{\rm obs}$ is the number of constant amplitude stress cycles per year;

 n_{ADT} is the expected annual average daily traffic over the lifetime of the structure; the value of n_{ADT} should not be taken less than 1000;

is the expected fraction of observed heavy lorries passing over the bridge, see EN 1991-2 clause 4.6 (e.g. α = 0,1);

is the design service life of the structure expressed in years according to EN 1990:2002 (e.g. 100 years).

A.2 Fatigue loading

$$\sigma_{d,max} \leq f_{fat,d} = k_{fat} \cdot \frac{f_k}{\gamma_{M,fat}}$$

(4) The value of k_{fat} should be taken as:

$$k_{\text{fat}} = 1 - \frac{1 - R}{a(b - R)} \log(\beta N_{\text{obs}}) \ge 0$$
where:
$$R = \sigma_{\text{d.min}} / \sigma_{\text{d.max}} \qquad \text{with } -1 = R = 1;$$

$$k_{\text{fat}} = 1 - \frac{1 - R}{a \cdot (b - R)} \cdot \log(\beta \cdot N_{\text{OBS}})$$
(A.5)

is the numerically smallest design stress from the fatigue loading; $\sigma_{\!
m d\ min}$

is the numerically largest design stress from the fatigue loading; $\sigma_{\rm d.max}$

 N_{obs} is the number of constant amplitude stress cycles as defined above;

is a factor based on the damage consequence for the actual structural component; β

are coefficients representing the type of fatigue action according to table A.1. *a*. *b*

The factor β should be taken as:

- Substantial consequences: $\beta = 3$
- Without substantial consequences: $\beta = 1$

A.3 Fatigue verification

Table A.1 – Values of coefficients a and b

	а	b	
Timber members in			
- compression, perpendicular or parallel to grain	2,0	9,0	
- bending and tension	9,5	1,1	
- shear	6,7	1,3	
connections with			
- dowels with $d = 12 \text{ mm}^a$	6,0	2,0	
- nails	6,9	1,2	

^aThe values for dowels are mainly based on tests on 12 mm tight-fitting dowels. Significantly larger diameter dowels or non-fitting bolts may have less favourable fatigue properties.

$$k_{fat} = 1 - \frac{1 - R}{a \cdot (b - R)} \cdot log(\beta \cdot N_{OBS})$$

	Pedestrian load and Low traffic load	<mark>_/200</mark> to _ℓ /400	

Deflections / Vibrations

System values

M - mass [t]

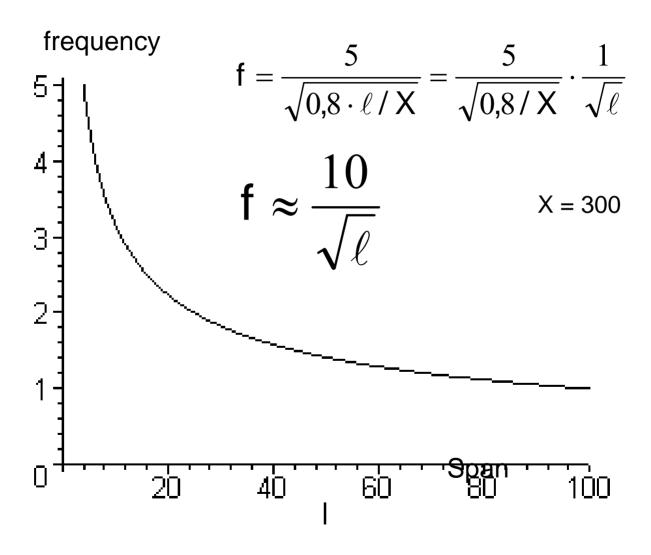

K - stiffness [kN/m]

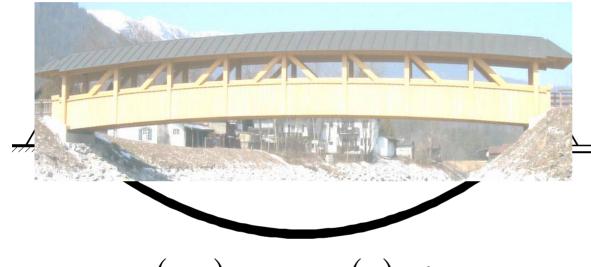

R – attenuation [kN/(m/s)]

$$\omega = \sqrt{\frac{\mathsf{K}}{\mathsf{M}}} = 2\pi \cdot \mathsf{f}$$

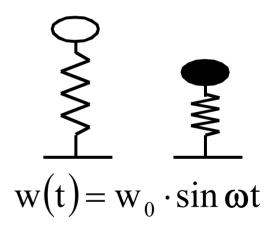

$$w_g = \frac{G}{K} = \frac{M \cdot g}{K} = \frac{g}{\omega^2} = \frac{g}{(2\pi \cdot f)^2}$$

$$f = \frac{5}{\sqrt{w_g}}$$

$$w(x,t) = w_0 \cdot \psi(x) \cdot \sin \omega t$$

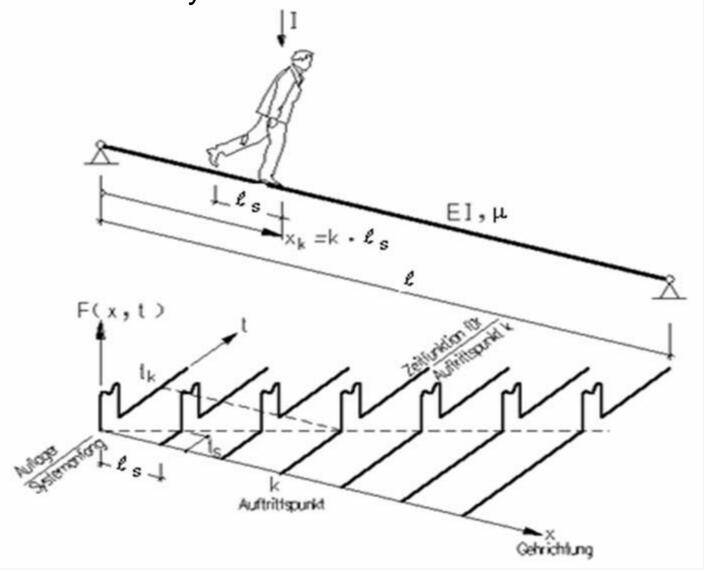

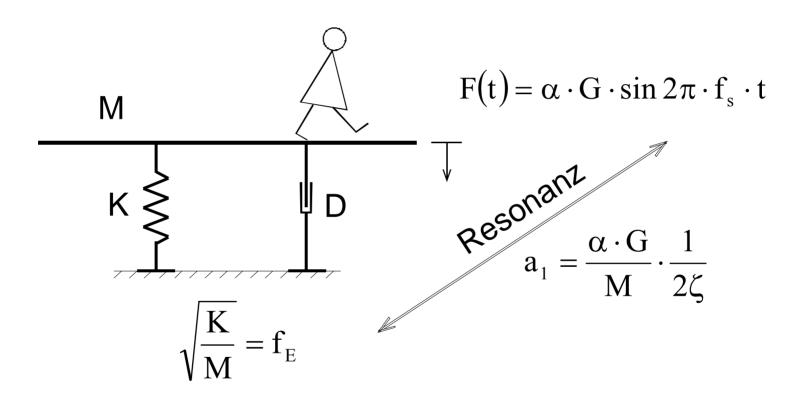

$$m = 1780 \text{ kg/m}$$
; $I = 67,7 \text{ m}$; $w_a = 8,8 \text{ cm}$

$$f = \frac{5}{\sqrt{0.8 \cdot w_g (in cm)}} = \frac{5}{\sqrt{0.8 \cdot 8.8}} = 1.9 Hz$$

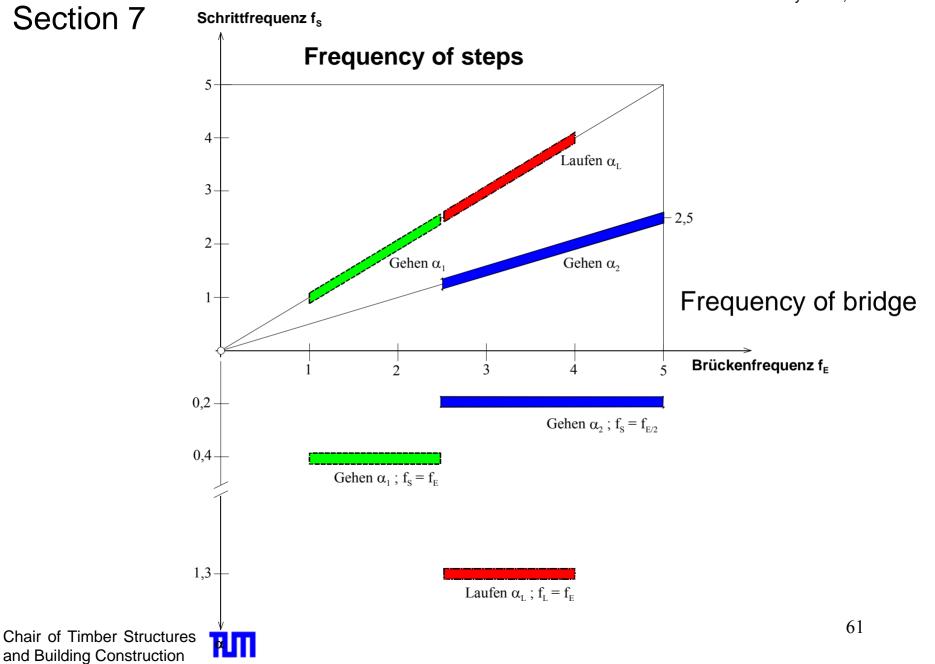

1 Person

$$a_{_{vert,1}} = \frac{\alpha \cdot G}{M} \cdot \frac{1}{2 \cdot \zeta} = \frac{200}{M_{_B} \cdot \zeta}$$

60

Annex B (informative) Vibrations caused by pedestrians B.1 General

(1) The rules given in this annex apply to timber bridges with simply supported beams or truss systems excited by pedestrians.

NOTE: Corresponding rules will be found in future versions of EN 1991-2.

B.2 Vertical vibrations

(1) For one person crossing the bridge, the vertical acceleration $a_{\text{vert},1}$ in m/s² of the bridge should be taken as:

$$a_{\text{vert},1} = \begin{cases} \frac{200}{M \zeta} & \text{for } f_{\text{vert}} \le 2,5 \text{ Hz} \\ \frac{100}{M \zeta} & \text{for } 2,5 \text{ Hz} \le 5,0 \text{ Hz} \end{cases}$$
(B.1)

where:

M is the total mass of the bridge in kg, given by $M = m \ell$;

is the span of the bridge;

m is the mass per unit length (self-weight) of the bridge in kg/m;

ζ is the damping ratio;

 f_{vert} is the fundamental natural frequency for vertical deformation of the bridge.

(2) For several persons crossing the bridge, the vertical acceleration $a_{\text{vert,n}}$ in m/s² of the bridge should be calculated as:

$$a_{\text{vert,n}} = 0.23 a_{\text{vert,1}} n k_{\text{vert}}$$
(B.2)

where:

n is the number of pedestrians;

 k_{vert} is a coefficient according to figure B.1;

 $a_{\text{vert},1}$ is the vertical acceleration for one person crossing the bridge determined according to expression (B.1).

The number of pedestrians, n, should be taken as:

- n = 13 for a distinct group of pedestrians;
- n = 0,6 A for a continuous stream of pedestrians.

where A is the area of the bridge deck in m^2 .

(3) If running persons are taken into account, the vertical acceleration $a_{\text{vert},1}$ in m/s² of the bridge caused by one single person running over the bridge, should be taken as:

$$a_{\text{vert},1} = \frac{600}{M \zeta}$$
 for 2,5 Hz < $f_{\text{vert}} \le 3,5$ Hz (B.3)

B.3 Horizontal vibrations

(1) For one person crossing the bridge the horizontal acceleration $a_{hor,1}$ in m/s² of the bridge should be calculated as:

$$a_{\text{hor},1} = \frac{50}{M \zeta}$$
 for 0,5 Hz $\leq f_{\text{hor}} \leq 2,5$ Hz (B.4)

where f_{hor} is the fundamental natural frequency for horizontal deformation of the bridge.

(2) For several persons crossing the bridge, the horizontal acceleration $a_{hor,n}$ in m/s² of the bridge should be calculated as:

$$a_{\text{hor,n}} = 0.18 \, a_{\text{hor,1}} \, n \, k_{\text{hor}}$$
 (B.5)

where:

 k_{hor} is a coefficient according to figure B.2.

The number of pedestrians, n, should be taken as:

- -n = 13for a distinct group of pedestrians;
- n = 0,6 A for a continuous stream of pedestrians,

where A is the area of the bridge deck in m2.

$$M = 120.000 \text{ kg}$$

Damping: D=0,01

 $a < 0.7 \text{ m/s}^2$

$$a_{vert,1} = \frac{200}{120000 \cdot 0,01} = 0,17 \frac{m}{s^2}$$

$$a_{\text{vert},13} = 0,23 \cdot 0,17 \cdot 13 = 0,51 \frac{\text{m}}{\text{s}^2}$$

$$a_{\text{vert,voll}} = 0,23 \cdot 0,17 \cdot 1 \cdot b \cdot 0,6$$

$$= 0,23 \cdot 0,17 \cdot 67,7 \cdot 3,24 \cdot 0,6 = 5,14 \frac{m}{s^2}$$

$$M = 60 t$$

$$R=16,7\;\frac{kN}{m/s}$$

$$D = 0.01$$

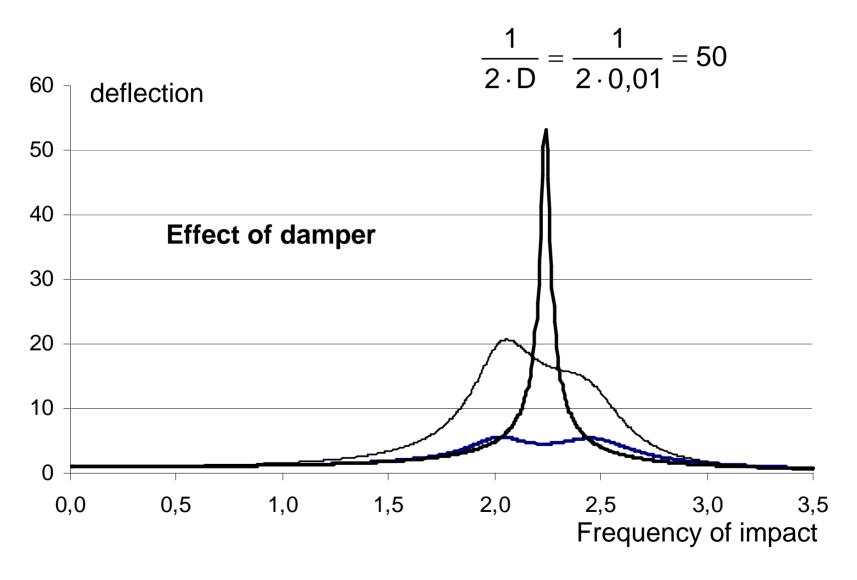

$$K = 12530 \text{ kN/m}$$

$$M_{D} = 3.4 t$$

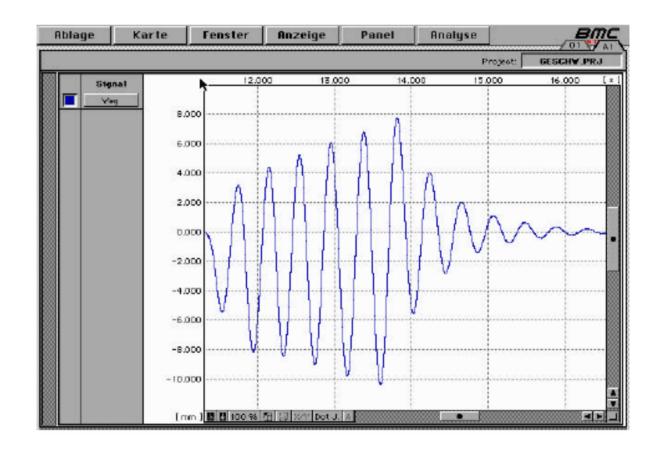

$$R = 12,5$$

$$D = 0,13$$

$$K = 636$$

Dämpferprotokoll, Gerb

Connection:

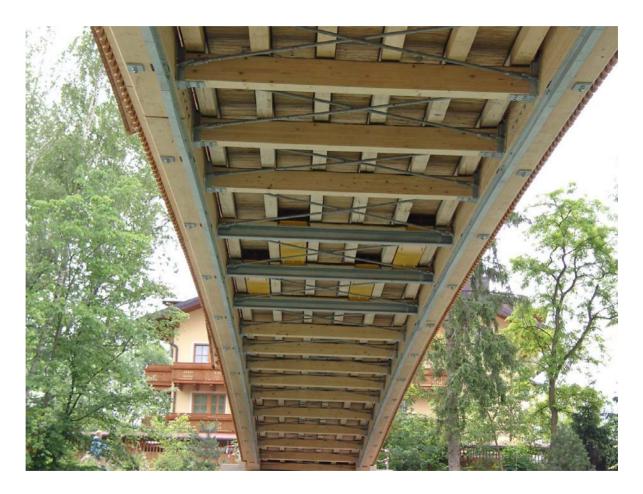

$$F_{D} = G_{D} \cdot \left(1 \pm \frac{a}{g} \cdot \frac{1}{2D_{D}} \sqrt{1 + (2D_{D})^{2}} \right)$$

The calculation:

$$G_D = M_D \times g = 3.2 \text{ t x } 9.81 \text{ m/s}^2 = 32 \text{ kN}$$

 $a = 0.7 \text{ m/s}^2$ limit of acceleration of the bridge movement $D_D = 0.1 \text{ value of damping}$

$$F_{D} = 34 \cdot \left(1 \pm \frac{0.7}{9.81} \cdot \frac{1}{2 \cdot 0.1} \sqrt{1 + \left(2 \cdot 0.1\right)^{2}}\right) = 34 \cdot \left(1 \pm 0.07 \cdot 4.81\right) = 34 \cdot \left(1 \pm 0.34\right) \text{kN}$$
